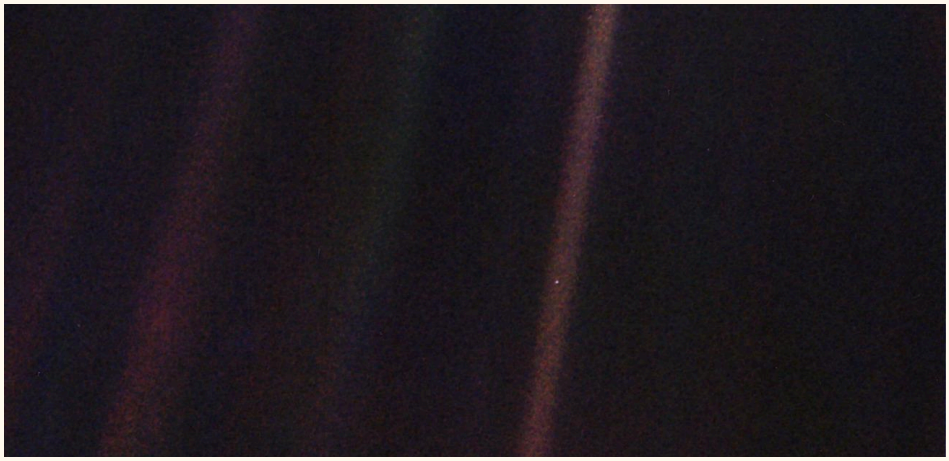
The Best Photograph Ever Taken by Humanity

By Taha Husain



Hello Everyone!! How's the Josh?!

Today, I am going to give a speech not on the topic you have in mind considering today's date but on a topic that's equally as intriguing. So…

Have you ever wondered what's considered the best Photograph ever taken by Humanity?

Well, let me reveal one of the best images humanity has ever taken…

This Photograph was taken on Valentine's Day of 1990. As everyone on Earth was celebrating Valentine's Day. The Voyager 1 spacecraft was 6 BILLION Kilometers away from us. Travelling through the dark abyss of Space all alone. When one of the crew members on the control team of Voyager 1 argued that they should turn the spacecraft around one last time and use some of it's already diminishing Power reserves to click a picture of the Earth. Now this image didn't mean anything in terms of Scientific Data but that individual argued that this image would serve as an inspiration for generations to come, And he was right.

That individual's name was Carl Sagan, One of History's most renowned Science Communicator and Astrophysicist. This image was later named "The Pale Blue Dot", showing the Earth as a Small Dot caught in a scattered Light Ray.

(Now, I cannot show you the image here but it's readily available on the web. So do check it out later!)

Carl Sagan released that image to the public and gave a speech that is remembered even today.

He said: "Look again at that Dot. That's here, That's us, That's Home… On it, everyone you ever knew, everyone you ever loved, Every dream, Every Smile, Every Aspiration, Every human you ever heard of, Every Human being who ever was. Lived their life on that Dot…". How amazing is that?!!
